

## **Scenario**

My client is in charge of IT at a property management and real estate company in China and he is currently using an OA (Office Automation) software based in China which has certain flaws that do not satisfy his needs. Several problems which my client is facing include it being too generalized as it does not tailor to the company specifically. It is also rigid such that there is no place for flexibility in features such as customizable themes, intuitive knowledge base, trustworthy budget calculation, as well as it may be too cluttered and unorganized making information harder to find. All of the above, and more, is frustrating for him and he is actively looking for a new software to be developed which would satisfy his current needs for an OA system with improvised current features and interface with additional features which would make the experience of using the app easier for the employees as well as the management team. For reference of the first interview, refer to the appendix.

## **Rationale for Proposed Solution**

My proposed solution, according to my client, is an OA software for the company which includes features such as having a knowledge base where the managers could post instructions for the staff to handle different situations, having an attendance recording for staff performance, department separation and department specific access for documents, databases, and more, and also human resources management such as staff information in a database, budgeting, staff salary calculations, and performance evaluations for management and admins and all information would be stored in such management system. The system would still be able to fulfill the needs which are being done by current application with improvisation and additional adjustments to tailor to the need of the company.

I would be using Java to code the software and meanwhile using the JFrame and/or additional interface programming to construct the application as a whole as it would be the most beneficial way to implement database with backend with MySQL database and in addition creating an application interface which will greatly improve the efficiency of programming with everything all in one place. For reference of the second interview, refer to the appendix.

Word Count: 190

## **Success Criteria**

1. Allow login for all three levels of users which are Admin, Manager, and Employee.
2. Admins can insert/update/delete all employee information.
3. Managers can view employee information for their department only.
4. Admins can store performance evaluations for all employees and managers can for in-department employees.
5. Salary and bonus computation is correct based on the model inputted by the user

6. All employees are viewable and searchable in a table.
7. Attendance System for Admins to mark each employee for absences and presences.
8. Message Board where Admins and Managers could post announcements and notices and employees can view the messages.
9. Budget allocations and related information are displayed in a pie-chart format viewable by Admins.
10. Minimalistic and Simplistic Design in interface where main features are highlighted.
11. Access and Entry will be restricted by the system based on the role of the user.
