

Evaluation of Product

This product is thoroughly evaluated to ensure accordance with the success criteria outlined by the clients in 'Criterion A' and will be supported by feedback from the client on multiple instances, as seen in the Appendix.

- 1. Login Functionality:** The product successfully implements a login system with three levels of roles: Admin, Manager, and an Employee. Each role grants access to different data and establishes a hierarchy appropriately. This was a critical requirement outlined by the client to secure sensitive information like salary, budgeting, bonus calculation, and performance evaluations.
- 2. Data Management and HR Functions:** The product includes functionalities for searching, creating, updating, and deleting employee records, maintaining an accurate database of staff information. The implementation of salary computation, bonus calculation, and attendance tracking were key features that were identified 'essential' in client interviews. In addition, all HR modules are also placed within the main HR menu navigation, emphasizing a minimalistic and modern design.
- 3. Performance Evaluation System:** The performance evaluation page allows managers and admins to evaluate employees within their department, while admins have access to view and manage all evaluations. It prevents managers from accessing sensitive data outside their departments.
- 4. Attendance Management:** The attendance tracking feature records employee presents and absences, accessible by admins present in the HR module. The client emphasized the need for accurate attendance records to support performance evaluation and payroll processing, a requirement that was effectively addressed by the module's integration. In addition, the attendance module also allows for reusability and scalability for multiple years as each year allows for increments on the attendance data.
- 5. Messaging and Knowledge Base System:** The messaging and knowledge base boards function as centralized communication tools, where all users can view posted messages or content.
- 6. User Interface and Design:** The user interface was designed with a minimalistic and modern aesthetic as per the client's preference for a clean and organized layout. The use

of pie charts for budget representation and a simple navigation structure align with the client's request for easy access to key functions.

- 7. System Flexibility and Scalability:** Flexibility was emphasized as a priority by the client to allow future expansion of functionalities such as new HR modules or budgeting tools. The current architecture supports the addition of new modules by utilizing OOP (object-oriented programming), ensuring that the system can scale without extensive rework and all permission setup will be able to handle the addition of more advanced analysis features outside current scope without affecting the program's integrity.
- 8. Data Validation and Input Handling:** Robust input validation mechanisms have been implemented to prevent erroneous data entry, particularly in critical areas such as salary input, date format, and employee ID entry. These measures align with the client's emphasis on data integrity and security as discussed in the previous review meeting, as seen in the appendix.

Overall, the product would successfully meet the 11 success criteria outlined by the client, with all major functions implemented and demonstrated to the client. For additional evidence and instance of client interviews and meetings, including discussions on specific functionalities, refer to the appendix.

Recommendations for the future development of the product

However, a noted limitation is the lack of targeted messaging to specific departments or users, which was suggested by the client during the product review meeting as a potential future enhancement outside of the outlined scope in the success criteria.
